Let me tell you why. I don't believe in a soul. I actually remember the exact moment when I lost faith in Souls. I was in the grocery store and I was listening to podcasts about split brain studies when you have to sever the corpus. Callosum, usually because of severe. Epilepsy. What you get is too independent frames that are having an independent conscious experience, and it was the size of the brain. And you can ask, do you believe in God and one side of the brain will and one side of the brain wall or you ask on, what do you want to do? You know, what do you want to be? What career do you want to have in one said race car driver? And one said, accountant fees were acting like two different people. And so it really challenging me this concept of a cell for a soul that is a single unified essence, or something that can even like transcend, the conditioning of the brain. And really, it started to make more sense to me that the concept of self is a constructs that emerges from the brains interconnected processes. So that was the moment that I lost my faith in a soul but I kept the rest.

With it. And I wanted to look at all sides and see how like apologist explain the soul and things like that, but I never got a good explanation that could stand up to this set of twins. This is Krista and Tatiana Hogan, and they are very special. They share a salamis. They have a bridge to each other's Thalamus because they have a shared brain. So if you cover one of their eyes and show something to the other twin day, they're not seeing it with their eyes, but they can know what the other twin is looking at because they're getting that information in their brain. If you touch one of their feet, they will get that sensory input to their brain. Even if you didn't touch, you know, that twins ft, they can share thoughts and emotions without speaking. And there's even an overlap of motor control where one twin can kind of take on the coordination of the other twins body. Now the question is, if Souls exist

Is it one solar too? Because if you argue that, they have two Souls, then the same exact argument should be for your own brain that you have two souls in your brain that are connected through a bridge of information because that is what they are. And if you say that I have one Soul even though I have two sides of the brain with information connected, then you would also have to say that they have one soul,

And how can they be one Soul? If they have different personalities, and they have different likes. And dislikes, one is more outgoing and the other one is more reserved. So if this is two Souls, then I am actually two Souls. That is Bridge together with an information Bridge because that's what they are.

Sophie even for how little we know about Consciousness and people who say that we don't understand Consciousness and you know, Energy's never created or destroyed through our Consciousness lives on. Even if that were so I still don't think you can make the jump to a soul meaning that there's an essence of Brittany that lives on after my brain dies. I just see no way for that to happen. The most pathetic that I can get for. You is when I die the elements that were me will go on to create other things and other things will get to experience being and hopefully someday in the future. A cell that used to become a tree and a cell that used to be a, you will be a bird and you'll land on my branches. And we'll share a moment again in a different way. Without knowing it, there's something poetic about that, there's something beautiful about that that I can appreciate but that's as far as I go with, like, after death Soul Consciousness, kind of stuff.

So whoever you are, thank you for sharing this 3 minutes with me. Maybe I'll see you again on a tree.
